# Milestone 1: Restock

Name: Stukalov Mikhail Vadimovich
Student ID: 3137193

## Main Idea

Restock is an Android app for keeping track of food and everyday supplies at home. Users can check what they have and what they need to buy. Each product has a status: In stock, Running low or Out of stock.

The idea is to put low and missing products on a shopping list. After shopping, users will be able to mark them as restocked. The final app will store the information on the phone using Room. Expiry dates and reminders may be added later.

## Objectives

The aim of this milestone was to make the basic screens and navigation. The current version includes:

- A Home screen with sample products, stock totals and category filters.
- A Shopping screen showing sample products that are low or missing.
- A product form with a name field and options for category and status.
- A Settings screen showing the planned shake shortcut and reminders.
- Bottom navigation between Home, Shopping and Settings, and a back button on the product form.

## UI Design

The app uses a light background and green buttons. Product cards have rounded corners. Stock labels use green, amber and red, with text showing what each colour means. There is also a dark theme that follows the phone setting.

On Home, products are grouped into Fridge, Pantry and Household. The sample list has eight products: four in stock, two running low and two out of stock. The category buttons filter the list. Add product opens an empty form.

The Shopping screen shows the four products that need to be bought. Tapping a product opens its details. The name, category and status can be changed in the form, but Save is disabled for now. The Settings screen explains the features planned for later.

## Current Progress and Next Steps

The app is written in Kotlin using Jetpack Compose. It has one activity, separate screen functions and a fixed list of sample products. Screen selection is handled using state variables. Icons are XML resources.

The project builds successfully. There is no database yet, so form changes do not update the product list. The next steps are saving products with Room, editing and deleting them, and marking purchases as restocked. Sharing the shopping list, the product details activity and the shake shortcut will follow. Expiry reminders are an optional extra.

## Screen Images

These images are Android Studio previews of the current interface. Home shows the full app layout. The other images show the screen content.
